Probe Array Image Inspection

10/43

- Saturation: PM or MM cells > 46000
- Defect Classes:
dimness/brightness, high Background, high/low intensity spots, scratches, high regional, overall background, unevenness, spots, Haze band, scratches, crop circle, cracked, snow, grid misalignment.
- As long as these areas do not represent more than 10% of the total probes for the chip, then the area **can be masked** and the data points thrown out as outliers.

Probe Array Image Inspection (conti.)

11/43

Li, C. and Wong, W. H. (2001) Model-based analysis of oligonucleotide arrays: Expression index computation and outlier detection, Proc. Natl. Acad. Sci. Vol. 98, 31-36.

Fig. 1. A contaminated D array from the Murine 6500 Affymetrix GeneChip® set. Several particles are highlighted by arrows and are thought to be torn pieces of the chip cartridge septum, potentially resulting from repeatedly pipetting the target into the array.

Fig. 5. (A) A long scratch contamination (indicated by arrow) is alleviated by automatic outlier exclusion along this scratch. (B and C) Regional clustering of array outliers (white bars) indicates contaminated regions in the original images. These outliers are automatically detected and accommodated in the analysis. Note that some probe sets in the contaminated region are not marked as array outliers, because contamination contributed additively to PM and MM in a similar magnitude and thus cancel in the PM-MM differences, preserving the correct signals and probe patterns.

B2 Oligo Performance

12/43

- Make sure the **alignment** of the grid was done appropriately.
- Look at the spiked in Oligo B2 control in order to check the **hybridization uniformity**.
- The border around the array, the corner region, the control regions in the center, are all checked to make sure the **hybridization** was successful.

Affymetrix CEL File Image- Yellow squares highlighting various Oligo B2 control regions: (A) one of the corner regions, (B) the name of the array, and (C) the "checkerboard" region.

MAS5.0 Expression Report File (*.RPT)

13/43

Report Type: Expression Report
Date: 04:42PM 02/24/2004

Filename: test.CHP
Probe Array Type: HG-U133A
Algorithm: Statistical
Probe Pair Thr: 8
Controls: Antisense

Alpha1: 0.05
Alpha2: 0.065
Tau: 0.015
Noise (RawQ): 2.250
Scale Factor (SF): 5.422
TGT Value: 500
Norm Factor (NF): 1.000

Background:
Avg: 64.23 Std: 1.75 Min: 59.50 Max: 67.70
Noise:
Avg: 2.54 Std: 0.14 Min: 2.10 Max: 3.00
Corner+
Avg: 49 Count: 32
Corner-
Avg: 5377 Count: 32
Central-
Avg: 4845 Count: 9

The following data represents probe sets that exceed the probe pair threshold and are not called "No Call".

Total Probe Sets: 22283
Number Present: 9132 41.0%
Number Absent: 12766 57.3%
Number Marginal: 385 1.7%

Average Signal (P): 1671.0
Average Signal (A): 119.6
Average Signal (M): 350.1
Average Signal (All): 759.3

- The Scaling Factor- In general, the scaling factor should be around three, but as long as it is not greater than five, the chip should be okay.
- The scaling factor (SF) should remain consistent across the experiment.

- Average Background: 20-100
- Noise < 4

- The measure of Noise (RawQ), Average Background and Average Noise values should remain consistent across the experiment.

- Percent Present : 30~50%, 40~50%, 50~70%.
- Low percent present may also indicate degradation or incomplete synthesis.

MAS5.0 Expression Report File (*.RPT)

14/43

- Sig (3'/5')- This is a ratio which tells us how well the labeling reaction went. The two to really look at are your 3'/5' ratio for GAPDH and B-ACTIN. In general, they should be less than three.

- Spike-In Controls (BioB, BioC, BioD, Cre)- These spike in controls also tell how well your labelling reaction went. BioB is only Present half of the time, but BioC, BioD, & Cre should always have a present (P) call.

Housekeeping Controls:

Statistical Plots: Histogram

- $1/2h$ adjusts the height of each bar so that the total area enclosed by the entire histogram is 1.
- The area covered by each bar can be interpreted as the probability of an observation falling within that bar.

Disadvantage for displaying a variable's distribution:

- selection of origin of the bins.
- selection of bin widths.
- the very use of the bins is a distortion of information because any data variability within the bins cannot be displayed in the histogram.

O. Bin origin at 120, bin widths of 20.

A. Bin origin at 125, bin widths of 20.

B. Bin origin at 120, bin widths of 5.

C. Bin origin at 120, bin widths of 10.

Density Plots

density(x = x[, 1], from = 4, to = 16)

density(x = y[, 1], from = 4, to = 16)

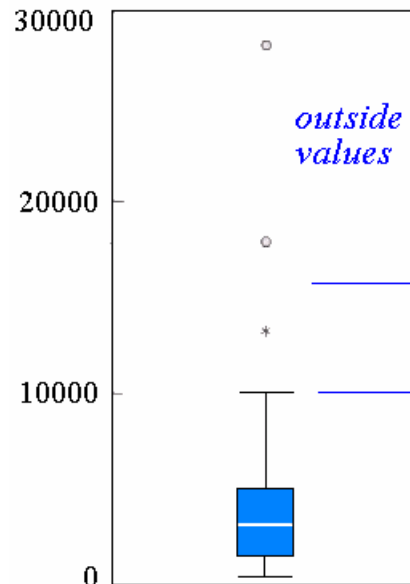

Figure Sources: Jacoby (1997).

Statistical Plots: Box Plots

- Box plots (Tukey 1977, Chambers 1983) are an excellent tool for conveying **location and variation** information in data sets.
- For detecting and illustrating location and variation changes between different groups of data.

Upper Outer Fence:
 $x_{0.75} + 3 \text{ IQR}$

Upper Inner Fence:
 $x_{0.75} + 1.5 \text{ IQR}$

Lower Inner Fence:
 $x_{0.25} - 1.5 \text{ IQR}$

Lower Outer Fence:
 $x_{0.25} - 3 \text{ IQR}$

The box plot can provide answers to the following questions:

- Is a factor significant?
- Does the location differ between subgroups?
- Does the variation differ between subgroups?
- Are there any outliers?

Further reading:
<http://www.itl.nist.gov/div898/handbook/eda/section3/boxplot.htm>

Scatterplot and MA plot

17/43

- **Features of scatterplot.**
 - the substantial **correlation** between the expression values in the two conditions being compared.
 - the preponderance of low-intensity values. (the majority of genes are expressed at only a low level, and relatively few genes are expressed at a high level)
- **Goals:** to identify genes that are differentially regulated between two experimental conditions.

$$M = \log_2 \left(\frac{Y}{X} \right)$$

$$A = \frac{1}{2} \log_2 (XY)$$

Oligo	cDNA
X = PM ₁ ,	X = Cy3
Y = PM ₂	Y = Cy5
X = PM ₁ · MM ₁ ,	
Y = PM ₂ · MM ₂	

Scatterplot and MA plot (conti.)

18/43

- **MA plots** can show the intensity-dependant ratio of raw microarray data.
 - x-axis (mean log₂ intensity): average intensity of a particular element across the control and experimental conditions.
 - y-axis (ratio): ratio of the two intensities. (fold change)

- **Outliers in logarithm scale**

- spreads the data from the lower left corner to a more centered distribution in which the prosperities of the data are easy to analyze.
- easier to describe the fold regulation of genes using a log scale. In log₂ space, the data points are symmetric about 0.

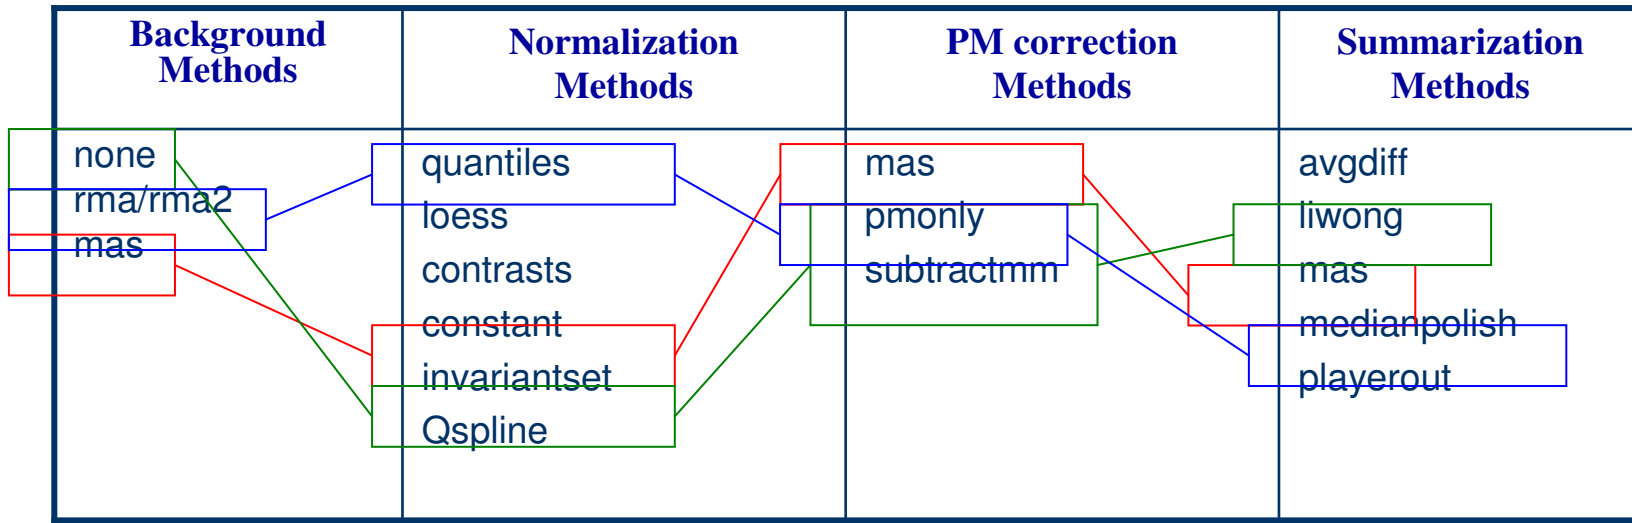

Low level Analysis

- Background correction (local vs. global)
- Normalization (baseline array vs. complete data)
- PM Correction
- Summarization [Expression Index] (single vs. multiple chips)

Low level analysis

20/43

The Bioconductor: affy package

- **MAS5**
`eset.mas5 <- expresso(Data, bg.correct="mas", normalize.method = "constant",
 pmcorrect.method="mas", summary.method="mas")`

 pmcorrect.method="pmonly", summary.method="liwong")`
- **Liwong (PM-MM Model)**
`eset.liwong <- expresso(Data, bg.correct=FALSE, normalize.method = "invariantset",
 pmcorrect.method="subtractmm ", summary.method="liwong")`
- **RMA**
`eset.rma <- expresso(Data, bg.correct="rma", normalize.method = "quantiles",
 pmcorrect.method="pmonly", summary.method="medianpolish")`
- **Other**
`eset <- expresso(Data, bg.correct="mas", normalize.method="qspline",
 pmcorrect.method="subtractmm", summary.method="playerout")`

Background Correction

21/43

What is background?

- A measurement of signal intensity caused by auto fluorescence of the array surface and non-specific binding.
- Since probes are so densely packed on chip must use probes themselves rather than regions adjacent to probe as in cDNA arrays to calculate the background.
- In theory, the MM should serve as a biological background correction for the PM.

What is background correction?

- A method for removing background noise from signal intensities using information from only one chip.

Why Normalization?

22/43

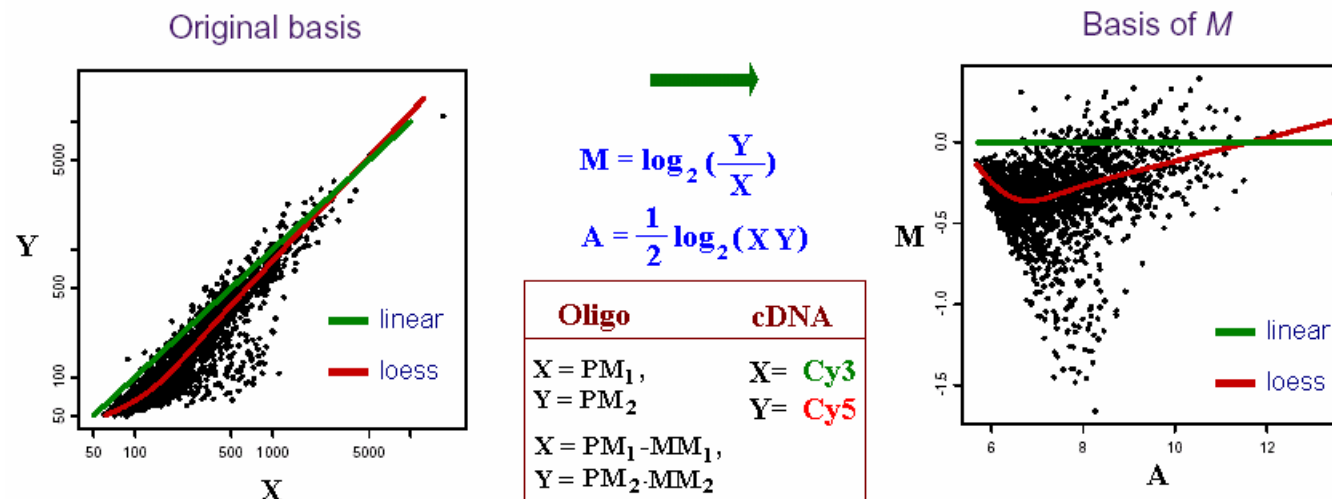

Normalization corrects for overall chip brightness and other factors that may influence the numerical value of expression intensity, enabling the user to more confidently compare gene expression estimates between samples.

Main idea

Remove the systematic bias in the data as completely possible while preserving the variation in the gene expression that occurs because of biologically relevant changes in transcription.

Assumption

- The average gene does not change in its expression level in the biological sample being tested.
- Most genes are not differentially expressed or up- and down-regulated genes roughly cancel out the expression effect.

The Options on Normalization

23/43

■ Levels

- PM&MM, PM-MM, Expression indexes

■ Features

- All, Rank invariant set, Spike-ins, housekeeping genes.

■ Methods

- Complete data: no reference chip, information from all arrays used: Quantiles Normalization, MVA Plot + Loess
- Baseline: normalized using reference chip: MAS 4.0, MAS 5.0, Li-Wong's Model-Based, Qspline

Constant Normalization

Normalization and Scaling

- The data can be normalized from:
 - a limited group of probe sets.
 - all probe sets.

Global Scaling

the average intensities of all the arrays that are going to be compared are multiplied by scaling factors so that all average intensities are made to be numerically equivalent to a preset amount (termed target intensity).

$$SF = \frac{TGT}{TrimMean(2^{SignalLogValue_i}, 0.02, 0.98)}$$

$$A \times SF = TGT$$

$$\Rightarrow SF = \frac{TGT}{A}$$

Global Normalization

the normalization of the array is multiplied by a Normalization Factor (NF) to make its Average Intensity equivalent to the Average Intensity of the baseline array.

$$A_{exp} \times NF = A_{base}$$

$$\Rightarrow NF = \frac{A_{base}}{A_{exp}}$$

$$nf = \frac{TrimMean(SPVB_i, 0.02, 0.98)}{TrimMean(SPVE_i, 0.02, 0.98)}$$

Average intensity of an array is calculated by averaging all the Average Difference values of every probe set on the array, excluding the highest 2% and lowest 2% of the values.

LOESS Normalization

- Loess normalization (Bolstad *et al.*, 2003) is based on **MA plots**. Two arrays are normalized by using a loess smoother.
- Skewing** reflects experimental artifacts such as the
 - contamination of one RNA source with genomic DNA or rRNA,
 - the use of unequal amounts of radioactive or fluorescent probes on the microarray.
- Skewing can be corrected with local normalization: fitting a local regression curve to the data.

Loess regression
(locally weighted polynomial regression)

- For any two arrays i, j with probe intensities x_{ki} and x_{kj} where $k = 1, \dots, p$ represents the probe
- we calculate $M_k = \log_2(x_{ki}/x_{kj})$ and $A_k = \frac{1}{2} \log_2(x_{ki}x_{kj})$.
- A normalization curve is fitted to this M versus A plot using loess.

Loess is a method of local regression (see Cleveland and Devlin (1988) for details).

- The fits based on the normalization curve are \hat{M}_k
- the normalization adjustment is $M'_k = M_k - \hat{M}_k$.
- Adjusted probe intensities are given by $x'_{ki} = 2^{A_k + \frac{M'_k}{2}}$ and $x'_{kj} = 2^{A_k - \frac{M'_k}{2}}$.

$$M = \log_2\left(\frac{Y}{X}\right)$$

$$A = \frac{1}{2} \log_2(XY)$$

Oligo	cDNA
X = PM ₁ ,	X = Cy3
Y = PM ₂	Y = Cy5
X = PM ₁ · MM ₁ ,	
Y = PM ₂ · MM ₂	

PM Correction Methods

26/43

■ PM only

make no adjustment to the PM values.

■ Subtract MM from PM

This would be the approach taken in MAS 4.0 Affymetrix (1999). It could also be used in conjunction with the liwong model.

Table 1: Summary Table

Method	Assumptions	Benefits	Drawbacks
PM-MM	Background effects are large and potentially variable between features across experiments relative to effects of interest	Background effects minimized due to low bias Sensitivity to low expressors	Slightly noisier when signal is higher than background
PM-B	Features have approximately the same background	Low noise	May not represent all probe sets accurately, typically leading to underestimated differential change
PM Only	Background variation is insignificant	Low noise Approximately constant CV	All probe sets biased Compression of differential change at the low end
MM treated as additional PM	Background variation is insignificant Abundances moderate to large	Added statistical power Low noise Constant CV	All probe sets biased Compression of differential change at the low end

Affymetrix: Guide to Probe Logarithmic Intensity Error (PLIER) Estimation. Edited by: Affymetrix I. Santa Clara, CA, ; 2005.

Expression Index Estimates

27/43

Summarization

- Reduce the 11-20 probe intensities on each array to a single number for gene expression.
- The goal is to produce a measure that will serve as an indicator of the level of expression of a transcript using the PM (and possibly MM values).
- The values of the PM and MM probes for a probeset will be combined to produce this measure.
- **Single Chip**
 - avgDiff : no longer recommended for use due to many flaws.
 - **Signal** (MAS5.0): use One-Step Tukey biweight to combine the probe intensities in log scale
 - average log 2 (PM - BG)
- **Multiple Chip**
 - **MBEI** (li-wong): a multiplicative model
 - **RMA**: a robust multi-chip linear model fit on the log scale

Three Well-Known Methods

- MAS5 & PLIER
- Li-Wong Model
- RMA

Affymetrix: Guide to Probe Logarithmic Intensity Error (PLIER) Estimation. Edited by: Affymetrix I. Santa Clara, CA, ; 2005.

Liwong: Normalization

30/43

Liwong (PM-only Model)

```
eset.liwong <- expresso(Data, bg.correct=FALSE, normalize.method = "invariantset",  
                        pmcorrect.method="pmonly", summary.method="liwong")
```

Liwong (PM-MM Model)

```
eset.liwong <- expresso(Data, bg.correct=FALSE, normalize.method = "invariantset",  
                        pmcorrect.method="subtractmm ", summary.method="liwong")
```

- Using a baseline array, arrays are normalized by selecting invariant sets of genes (or probes) then using them to fit a *non-linear relationship* between the "treatment" and "baseline" arrays.
- A set of probe is said to be invariant if ordering of probe in one chip is same in other set.
- Fit the non-linear relation using cross validated smoothing splines (GCVSS).

... invariant differences
... GCVSS fit

(Li and Wong, 2001)

invariant set

Liwong: Summarization Method

31/43

(Model-Based Expression Index , MBEI)

- θ_i : this model computes an expression level on the i th array.
- $SE(\theta)$'s and $SE(\phi)$'s: can be used to identify outlier arrays and probes that will consequently be excluded from the final estimation of the probe response pattern.
- **Outlier array**: large $SE(\theta_i)$, possibly due to external factors like the imaging process.
- **Outlier probe**: large $SE(\phi_j)$, possibly due to non-specific cross-hybridization.
- **Single outliers**: individual PM-MM differences might also be identified by large residuals compared with the fit. (these are regarded as missing values in the model-fitting algorithm).

RMA: Background Correction

32/43

RMA

```
eset.rma <- expresso(Data, bg.correct="rma", normalize.method = "quantiles",  
                    pmcorrect.method="pmonly", summary.method="medianpolish")
```

RMA: Robust Multichip Average (Irizarry and Speed, 2003):
assumes PM probes are a convolution of Normal and Exponential.

Observed PM = Signal + Noise

$$O = S + N$$

Exponential (alpha)

Normal (mu, sigma)

Use $E[S|O=o, S>0]$ as the background corrected PM.

$$E(s|O = o) = a + b \frac{\phi\left(\frac{a}{b}\right) - \phi\left(\frac{o-a}{b}\right)}{\Phi\left(\frac{a}{b}\right) + \Phi\left(\frac{o-a}{b}\right) - 1}$$

$$a = s - \mu - \sigma^2 \alpha$$

$$b = \sigma$$

ϕ : standard normal density function

Φ : standard normal distribution function

Ps. MM probe intensities are not corrected by RMA/RMA2.

RMA: Normalization

33/43

- **Quantiles Normalization** (Bolstad *et al*, 2003) is a method to make the distribution of probe intensities the same for every chip.
- Each chip is really the transformation of an underlying common distribution.

X_{sort}

average
quantile

$$\frac{1}{N} \sum_{j=1}^N q_{ij}$$

The q th quantile of a data set is defined as that value where a q fraction of the data is below that value and $(1-q)$ fraction of the data is above that value. For example, the 0.5 quantile is the median.

- The two distribution functions are effectively estimated by the sample quantiles.
- The normalization distribution is chosen by averaging each quantile across chips.

1. Given N datasets of length p form X of dimension $p \times N$ where each dataset is a column
2. Set $d = \left(\frac{1}{\sqrt{N}}, \dots, \frac{1}{\sqrt{N}} \right)$
3. Sort each column of X to give X_{sort}
4. Project each row of X_{sort} onto d to get X'_{sort}
5. Get X_{norm} by rearranging each column of X'_{sort} to have the same ordering as original X

RMA: Summarization Method

34/43

MedianPolish

- This is the summarization used in the RMA expression summary Irizarry et al. (2003).
- A **multichip linear model** is fit to data from each probeset.
- The medianpolish is an algorithm (see Tukey (1977)) for fitting this model robustly.
- Please note that expression values you get using this summary measure will be in log₂ scale.

for a probeset k

$$\log_2 \left(PM_{ij}^{(k)} \right) = \alpha_i^{(k)} + \beta_j^{(k)} + \epsilon_{ij}^{(k)}$$

$i = 1, \dots, I_k$ probes

$j = 1, \dots, J$ arrays

probe effect

log₂ expression value

- [AffyExtensions](#) For fitting more general probe level models

The Bioconductor: affy

38/43

Quick Start: probe level data (*.cel) to expression measure.

```
> library(affy)
> getwd()
> list.celfiles()
> setwd("myaffy")
> getwd()
> list.celfiles()
> Data <- ReadAffy()

> eset.rma <- rma(Data)
> eset.mas <- expresso(Data,
                       normalize= FALSE,
                       bgcorrect.method="mas",
                       pmcorrect.method="mas",
                       summary.method="mas")

> eset.liwong <- expresso(Data,
                         normalize.method="invariantset",
                         bg.correct=FALSE,
                         pmcorrect.method="pmonly",
                         summary.method="liwong")

> eset.myfun <- express(Data,
                       summary.method=function(x)
                                   apply(x, 2, median))

> write(eset.rma, file="mydata_rma.txt")
> write(eset.mas, file="mydata_mas.txt")
> write.exprs(eset.liwong, file="mydata_liwong.txt")
> write(eset.myfun, file="mydata_myfun.txt")
```

```
expresso(
  afbatch,

  # background correction
  bg.correct = TRUE,
  bgcorrect.method = NULL,

GeneSpring GX v7.3.1

- RMA or GC-RMA probe level analysis
- Advanced Statistical Tools
- Data Clustering
- Visual Filtering
- 3D Data Visualization
- Data Normalization (Sixteen)
- Pathway Views
- Search for Similar Samples
- Support for MIAME Compliance
- Scripting
- MAGE-ML Export
